Difficult Questions...

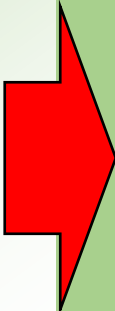

- *Can you afford another year of Lost Tourism or the Revenue it generates?*
- *Is your home or business becoming known as “A Toxic Water Site?”*
- *What happens when toxic levels threaten your family or your customers?*
- *Is your livelihood at risk - or your property value suffering?*
- *Are you ready to make a dent in something you didn't create?*

If you answered **YES** to ANY of these questions – then consider **AN-JET's Model: AJ-18**.

AN-JET's **Model: AJ-18** system is safe, effective, easy to set up and best of all – uses no harsh chemicals, or ultra-sonics - both known to harm sensitive marine life. It uses the power of earth's oxygen (derived from air) – to help disrupt the growth of algae, circulate the local water column and increase the O2 content of the water. It's even capable of attracting Oxygen Starved Marine Life like Manatees and Pelagic Fish starving for oxygen. Unit begins working the moment you start it up as countless O2 Enriched Tiny Bubbles go to work. But, no matter how good it is, let's be realistic. No algae system is perfect (including ours) - nor can it eliminate completely a naturally occurring problem. But when run continuously before (or during) an outbreak, it will make a positive improvement in local water quality.

Great Features and Benefits

- Easy to Use
- Economical
- Begins Working Right Away
- Safe (Please use common sense and follow directions)
- Quiet
- Works a Large Area
- Designed-in the Value
- High Quality Components

- 
- Substantial increase in Water Column Dissolved Oxygen – through two (2) distinct ways help make the water less suitable for runaway algae growth.
 - Increased uplift in the water column breaks stratification thermal barriers and promotes a more positive marine environment.
 - Marine life thrives on oxygen rich water.

“What a well-built system” – Jim Tracy, Idaho

Turn Over

"Houston – We Have a Problem!"

"...These organisms have the ability to produce some of the most potent toxins known to humankind. These toxins can affect liver and brain function. Many of the cyanobacteria produce toxins that can cause skin irritation. Due to the potency of these toxins and no known antidote, it is recommended that public health and other regulatory agencies take a conservative approach with human exposure to these toxins when setting recreational water thresholds.

Many of the health symptoms associated with exposure to cyanotoxins can mimic other illnesses and diseases and therefore may not be readily recognized by the medical community or the public. Some of these symptoms include nausea, skin rashes, gastro-intestinal distress, disorientation, numbness and fatigue..."

(State of Ohio Harmful Algal Bloom Response Strategy for Recreational Waters)

Harmful Algae Blooms (HABS) have become a major seasonal issue across the United States and the rest of the World.

It's time to fight back.

1. ***Get out in front of HAB development using AN-JET's Model: AJ-18 Aeration System.***
2. ***Prevent the HAB outbreak if possible.***
3. ***Avoid algae direct contact by wearing rubber gloves and a respirator within 50' of a surface bloom. Keep animals away from suspect water. Read and heed toxins warnings.***
4. ***Start aeration as soon as you can to mix the local water column AND add needed oxygen to the water!***

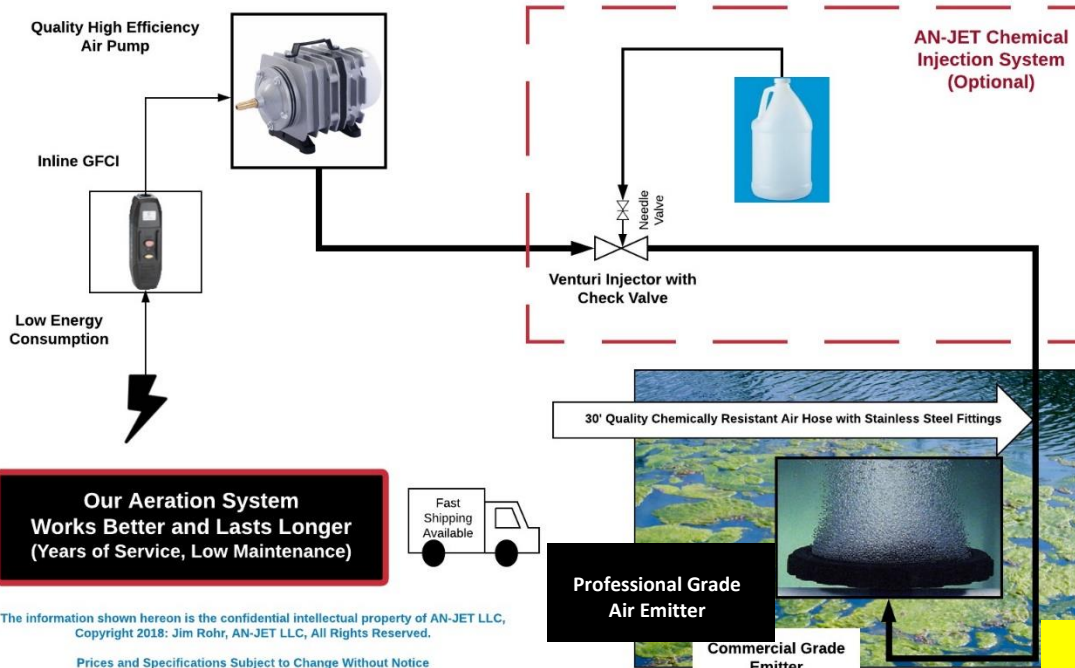

Even though you might not see it, harmful algae may be lurking below the surface - gaining strength. Don't wait till you see it– run this system early.

Model# **AJ-18**

"Portable Aeration System"

(Optional "AJ-CHEM-1: Chemical Injection System" also Shown)

ECO Friendly (Improves Marine Conditions)

Portable, lightweight.
Blower is just 16 Pounds!

Uses 10VAC Standard Electrical Power!

Make hose connections, plug it in, turn it on and lower the air emitter into the water (face up.)
It's That Simple.

Options and upgrades are available for your system. Find out more on our website.
