Are You *Terrified* that Your Software Could Be Hacked?

If you aren't, you should be...

We have all heard the horror stories of huge companies being hacked. Have you ever wondered what would happen if the Protected Health Information (PHI) in your practice were hacked? Do you know where you are most vulnerable?

It is at the end points where you or your staff members take their laptops or smart phones outside your office to communicate bi-directionally with your patients' records. That is where hackers try to compromise your data.

Your first thought may be about the fines that may be assessed by HIPAA. But, also, you are responsible for your patients' data.

It is because Protected Healthcare Information is worth about \$500.00 per copy to hackers on the black market. The reason is that it contains the patient's demographic, health care, insurance, driver's license, credit card and other sensitive information. <http://www.forrester.com/pimages/rws/reprints/document/117248/oid/1-RK2ORR>

**With MedFormix<sup>®</sup>Vue the  
Personal Healthcare Information (PHI)  
Data in Your Practice is Safe!**

However, Crowell Systems' MedFormix<sup>®</sup>Vue is extremely secure if clients follow our simple directions; the data will be safe and secure because the patients' data *always* remains on the server. The level of encryption on both the server's firewall and portal make almost impossible for hackers to get away with their skullduggery.

## How Secure is the Cloud?

Jim Reavis, Executive Director of Cloud Alliance states, "We expect a whole new generation of malware to come out that are specifically designed for cloud providers."
