Micro-Flite Shafts are made absolutely straight and since fibreglas is impervious to the elements and unbelievably resilient to the forces of head-on impact, they stay straight. They will not corrode, become distorted from any cause, or crystallize and, through years of usage, will maintain all their original qualities. Critically controlled production methods provide such absolute uniformity that every shaft is the twin of every other shaft in its production run. Micro-Flite shafts are made in twelve different diameters and weights as shown on charts below.
