Subject: RE: Medical Information enquiry regarding COVID-19 mRNA Vaccine BNT162b2

Thank you so much everyone for keeping us in the loop on this. From the perspective of corporate affairs, we want to avoid having the information on the fetal cells floating out there. As you can all appreciate, we are communicating on this vaccine across multiple fronts and managing issues that arise. In this heated environment of heightened scrutiny on every detail on our vaccine, we would like to avoid creating an opportunity to raise an issue – we believe that the risk of communicating this right now outweighs any potential benefit we could see, particularly with general members of the public who may take this information and use it in ways we may not want it out there. We have not received any questions from policy makers or media on this issue in the last few weeks, so we want to avoid raising this if possible. If you want to expand on the below to explain how our vaccine is made and what mRNA is, that could be an avenue worth exploring to expand on the response.

As much as we can focus on the production side of things, that will help us immensely. This guidance has been consistently shared across the board on inquiries we have received on this sensitive topic.

Thanks so much – who is this information for? We have been trying as much as possible to not mention the fetal cell lines. So we would really like to stay focused on the first part if possible – this is what we have said most recently for inquiries received via our Board of Directors and through direct emails to Mikael Dolsten...The piece in yellow we have tried really hard to not share unless it's strictly necessary and mission critical.

Human fetal derived cell lines are not used to produce our investigational vaccine, which consists of synthetic and enzymatically produced components. One or more cell lines with an origin that can be traced back to human fetal tissue has been used in laboratory tests associated with the vaccine program.

Hi Advait,

Copying Vanessa Gelman from our Communications group. We have an approved answer to this question, which she probably can provide. HEK293T cells, used for the IVE assay, are ultimately derived from an aborted fetus. On the other hand, the Vatican doctrinal committee has confirmed that they consider it acceptable for Pro-Life believers to be immunized.

Pfizer's official statement couches the answer well and is what should be provided in response to an outside inquiry.

Best,

Phil

Hi there,

I assume the answer to the question in "**bold**" below is NO. Can you confirm?

Hi Vanessa. This question came in as an enquiry to our Med Info group. Specifically they are asking "did Pfizer make use of a cell line from an aborted foetus when carrying out any confirmatory tests for this vaccine?"

This is AFTER we had already confirmed with the customer that no cell lines from an aborted foetus were used in the manufacturing process of the COVID-19 mRNA Vaccine BNT162b2.

Hi Ambereen,

Suggest we stick with the suggested wording from our Communications group. Don't want to have multiple versions circulating, and the statement has been extensively vetted.

Best,

Phil
